designed for a life well lived.

Confidential — F&F Internal Documentation — 2025

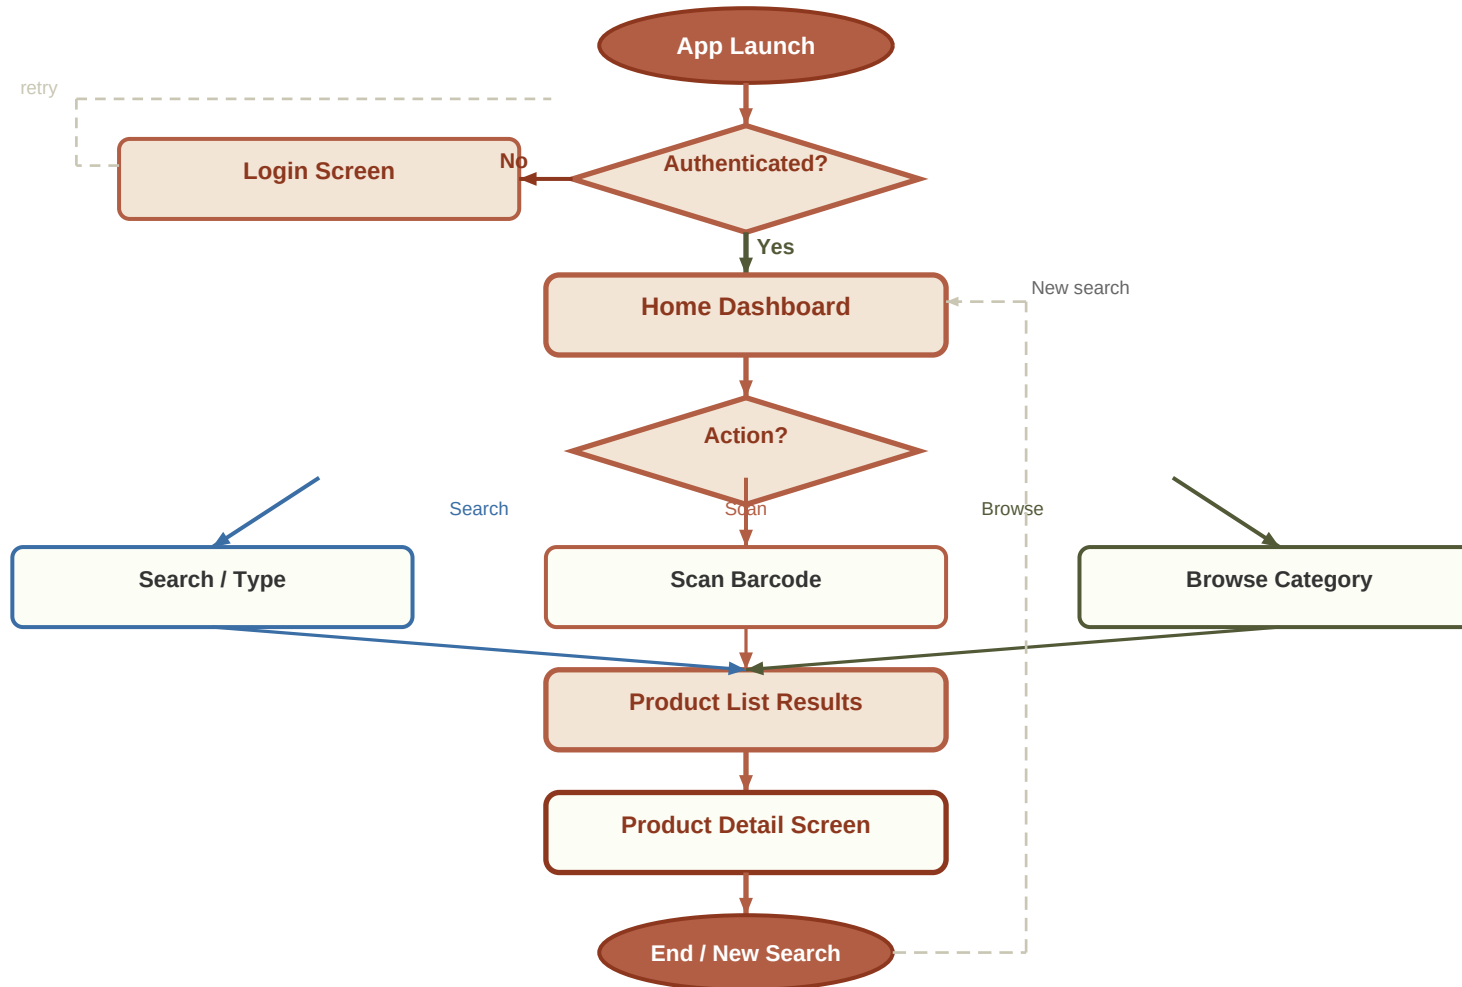

System Architecture Overview

All components and how they connect — frontend → backend → data sources

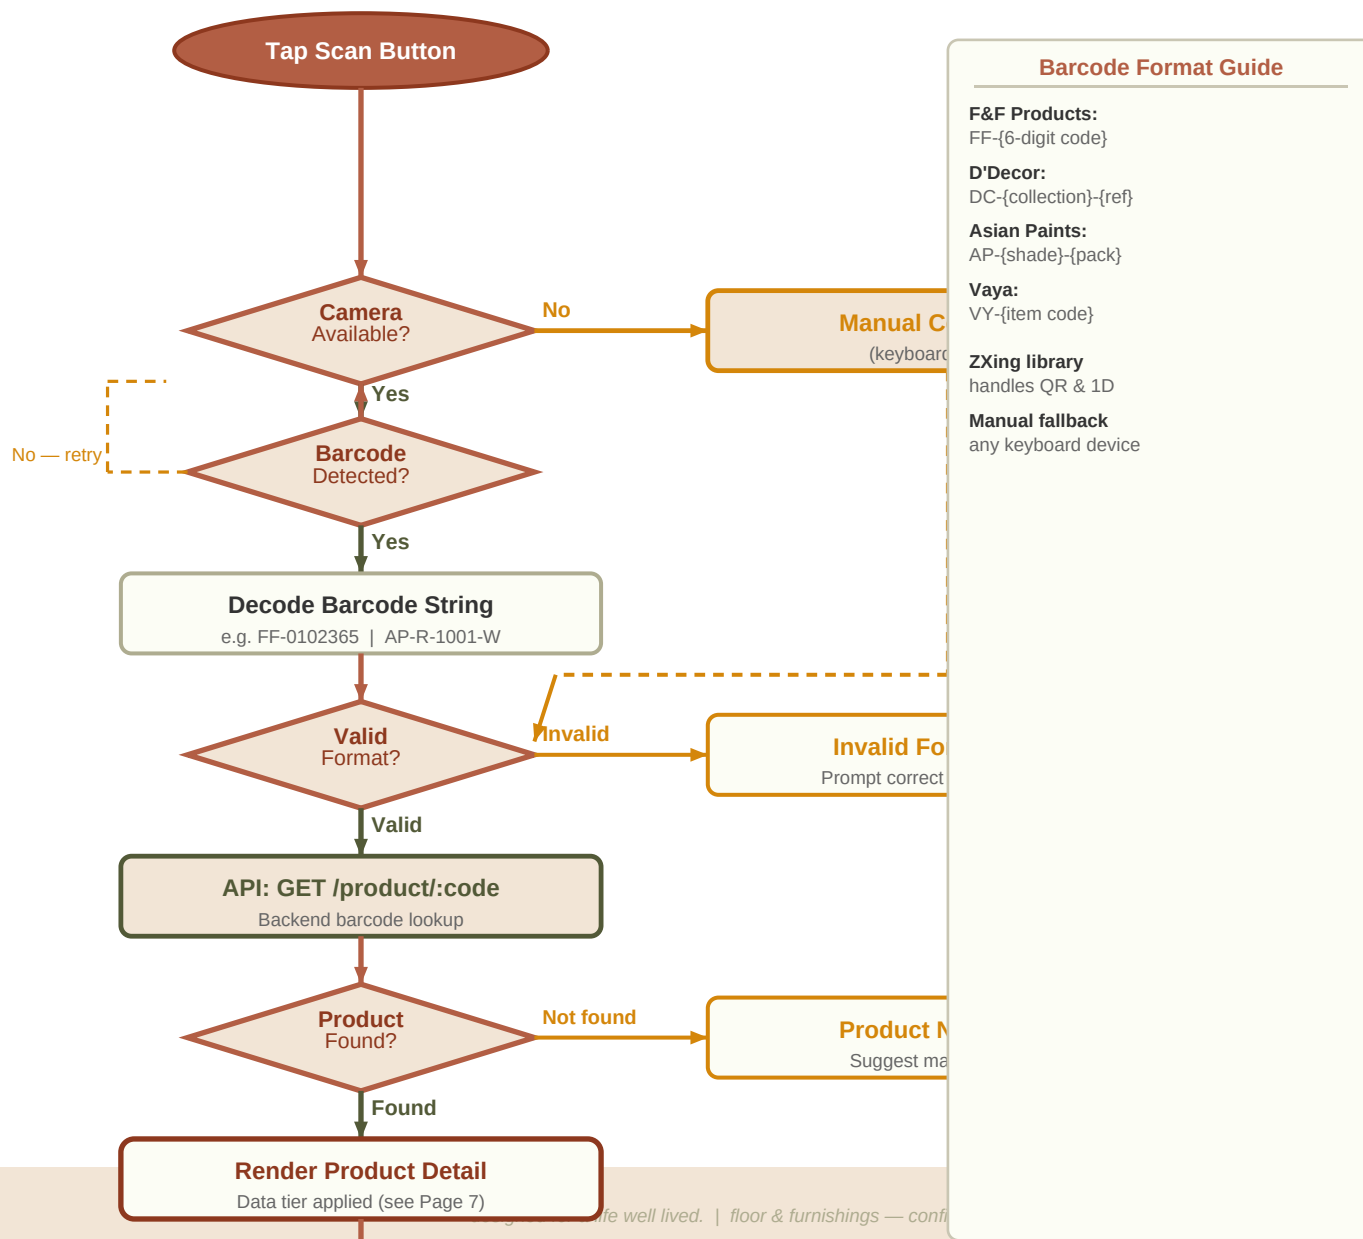

Core App User Flow

Complete journey: launch → authentication → action → product result

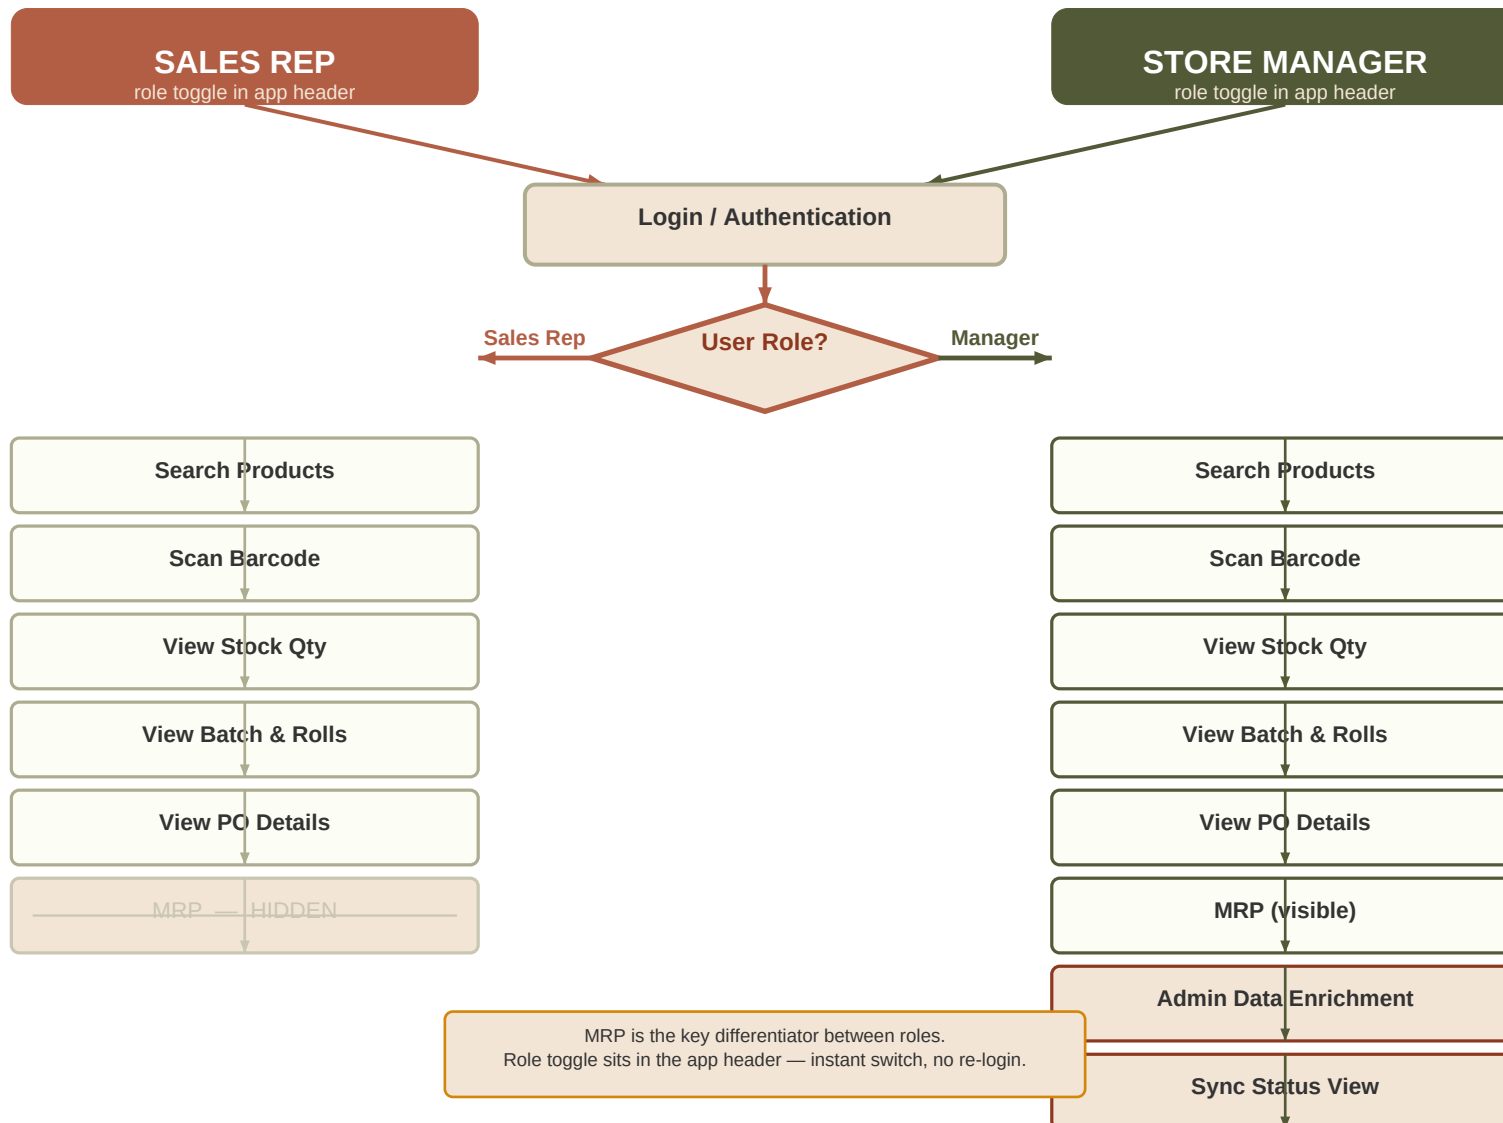

Barcode Scanning Flow

Camera trigger → decode → validation → API lookup → result (with manual fallback)

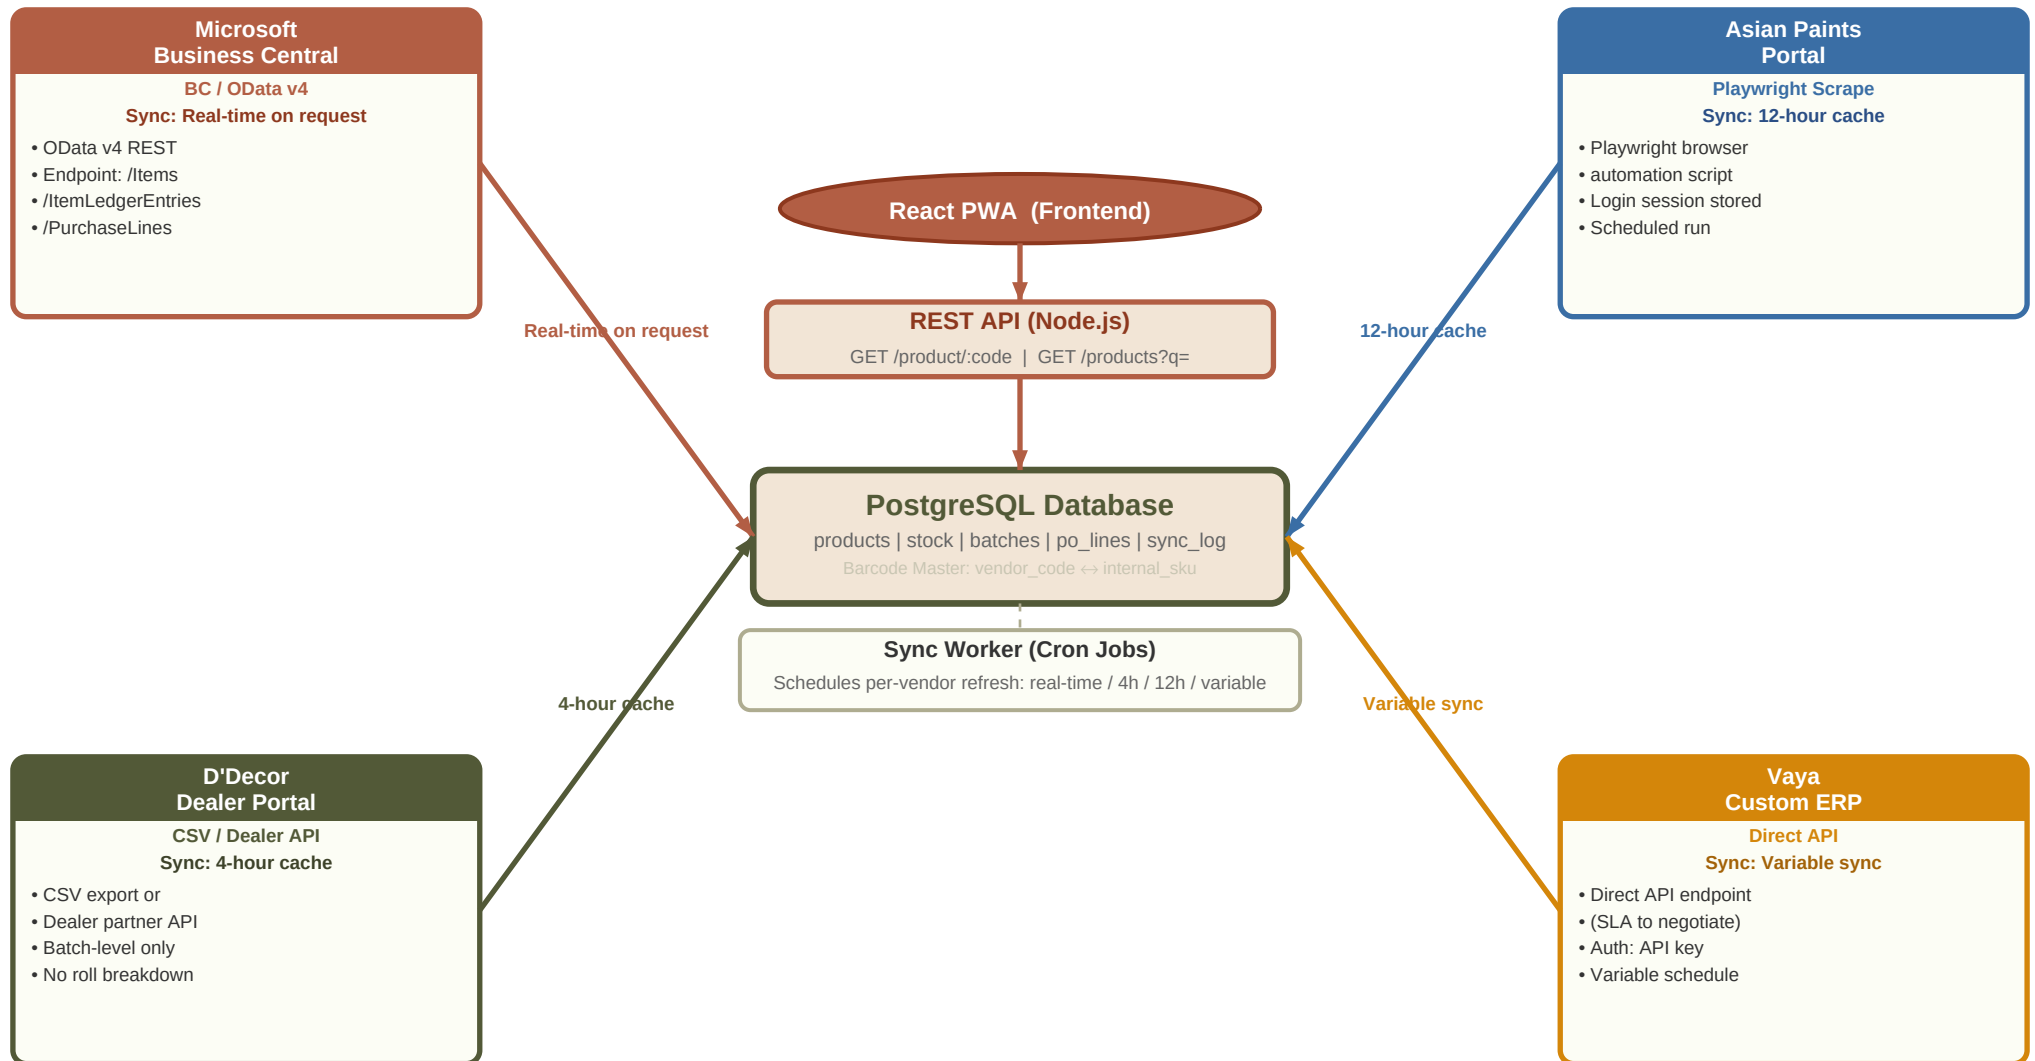

Role-Based Access Flow

What Sales Rep vs Store Manager can see and do

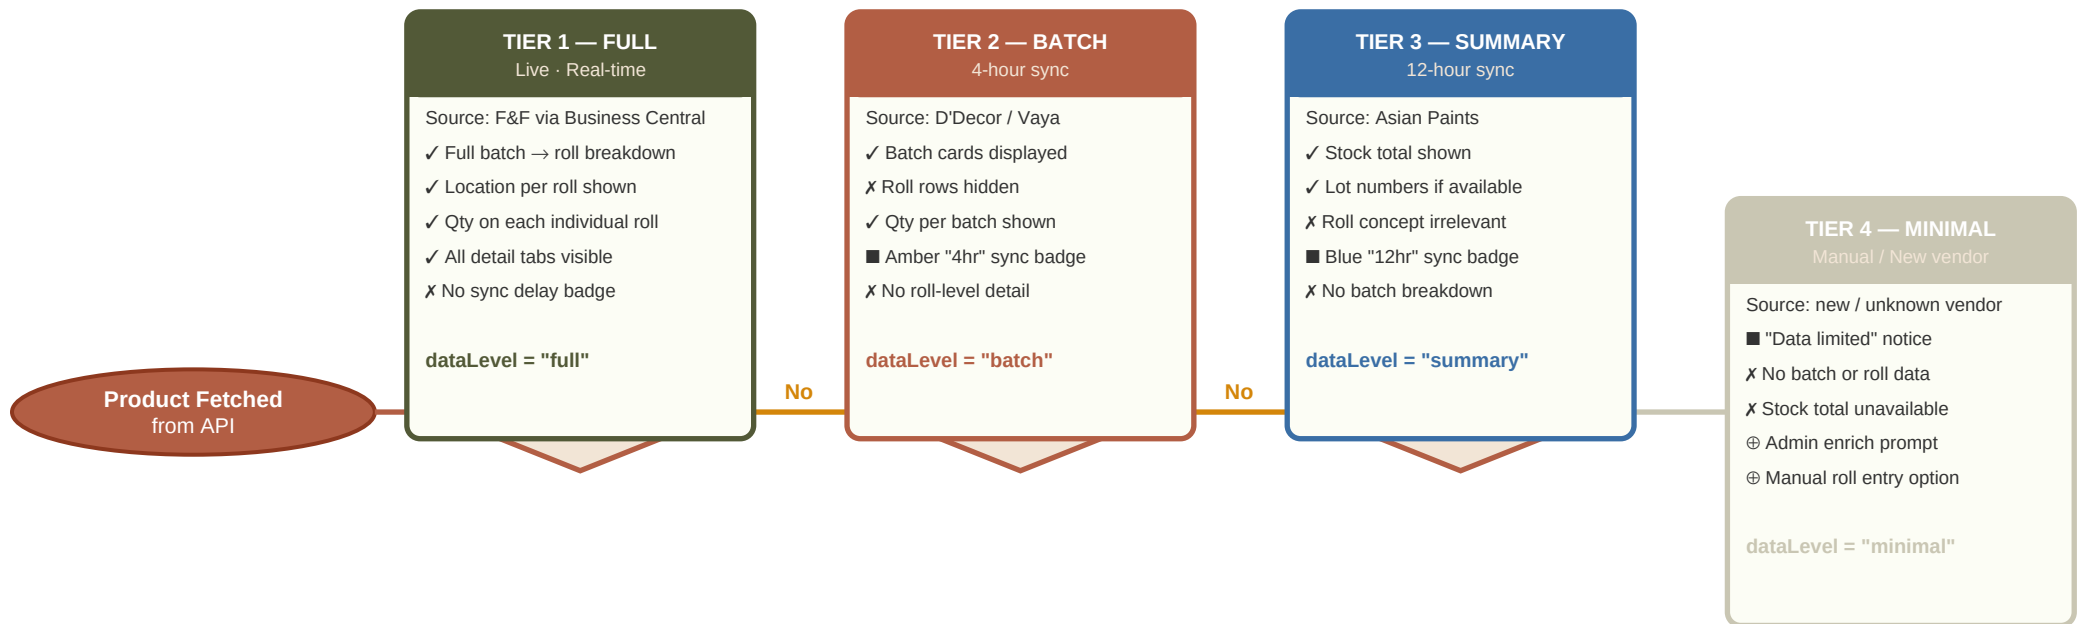

Backend Data Integration Flow

How each vendor's data is fetched, cached and stored in PostgreSQL

Data Tier Decision System

How the backend assigns display tiers to handle missing vendor data gracefully

dataLevel is assigned by the backend sync worker — the frontend never knows the vendor name.
Adding a new vendor requires no UI changes — only a new sync connector + dataLevel assignment.

Product Detail Screen Flow

From tapping a result to full stock detail — all tabs, tiers and edge cases
